 - Update the Astra Data Store license 40
 - Upgrade Astra Data Store 41
 - Uninstall Astra Data Store with an automated script 43

Use Astra Data Store

Manage Astra Data Store resources with kubectl commands

You can manage Astra Data Store resources by using kubectl commands and by using the Kubernetes API extension.

To learn how to deploy a sample app, see [Deploy a test application](#).

For cluster maintenance information, see [Manage the cluster](#).

What you'll need

- The Astra Data Store kubectl plugin you installed in [Install Astra Data Store](#)

List Kubernetes custom API resources for Astra Data Store

You can use kubectl commands inside of Kubernetes to interact with and observe the state of your Astra Data Store cluster.

Each item listed from the `api-resources` command represents a Kubernetes custom resource definition (CRD) that Astra Data Store uses internally to manage your cluster.

This list is particularly helpful to get short names of each Astra Data Store object to reduce your typing, as shown later.

1. Display a list of Kubernetes custom API resources for Astra Data Store:

```
kubectl api-resources --api-group astrads.netapp.io
```

Response:

NAME	SHORTNAMES	APIGROUP	NAMESPACED	KIND
astradsautosupports	adsas	astrads.netapp.io/v1alpha1	true	
AstraDSAutoSupport				
astradscLOUDsnapshots	adscs	astrads.netapp.io/v1alpha1	true	
AstraDSCloudSnapshot				
astradsclusters	adscl	astrads.netapp.io/v1alpha1	true	
AstraDSCluster				
astradsexportpolicies	adsep	astrads.netapp.io/v1alpha1	true	
AstraDSEExportPolicy				
astradsfaileddrives	adsfd	astrads.netapp.io/v1alpha1	true	
AstraDSFailedDrive				
astradslicenses	adsli	astrads.netapp.io/v1alpha1	true	
AstraDSLICENSE				
astradsnfsoptions	adsnf	astrads.netapp.io/v1alpha1	true	
AstraDSNfsOption				
astradsnodeinfoes	adsni	astrads.netapp.io/v1alpha1	true	
AstraDSNodeInfo				
astradsnodemanagements	adsnm	astrads.netapp.io/v1alpha1	true	
AstraDSNodeManagement				
astradsqospolicies	adsqp	astrads.netapp.io/v1alpha1	true	
AstraDSQosPolicy				
astradsversions	adsve	astrads.netapp.io/v1alpha1	true	
AstraDSVersion				
astradsvolumeFiles	adsvf	astrads.netapp.io/v1alpha1	true

9f1 true	Astra Data Store true	2022-02-07 2021-12-16T20:43:23Z

3. Use one of the short names to show the current state of volumes in the cluster:

```
kubectl get adsvo -A
```

Response:

NAMESPACE	NAME	SIZE	IP	CLUSTER
CREATED				
astrads-system	test234	21Gi	172.25.138.109	astrads-cluster-
9f1c99f true				
astrads-system	test2345	21Gi	172.25.138.111	astrads-cluster-
9f1c99f true				

Use the help option on the kubectl extension

NetApp provides an `astrads` extension to the `kubectl` command that enables you to perform Astra Data Store cluster management tasks such as adding a license, managing nodes, troubleshooting issues and expanding the Astra Data Store cluster. The `astrads` extension includes an `-h` option that provides information about how to use the extension and for what tasks.

1. Show help for all commands in the Astra Data Store `kubectl` extension:

```
kubectl astrads -h
```

Response:

```
A kubectl plugin for inspecting your AstraDS deployment

Usage:
  astrads [command]

Available Commands:
  asup      Manage AutoSupport
  clusters  Manage clusters
  drives    Manage drives in a cluster
  faileddrive Manage drive replacement in a cluster
  help      Help about any command
  license   Manage license in the astrads cluster
```

maintenance	Manage maintenance status of a node
monitoring	Manage Monitoring Output
nodes	Manage nodes in a cluster

Flags:

<code>--as</code> string	Username to impersonate for the operation
<code>--as-group</code> stringArray	Group to impersonate for the operation, this flag can be repeated to specify multiple groups.
<code>--cache-dir</code> string	Default HTTP cache directory (default "/u/arda/.kube/http-cache")
<code>--certificate-authority</code> string	Path to a cert file for the certificate authority
<code>--client-certificate</code> string	Path to a client certificate file for TLS
<code>--client-key</code> string	Path to a client key file for TLS
<code>--cluster</code> string	The name of the kubeconfig cluster to use
<code>--context</code> string	The name of the kubeconfig context to use
<code>-h, --help</code>	help for astrads
<code>--insecure-skip-tls-verify</code>	If true, the server's certificate will not be checked for validity. This will make your HTTPS connections insecure
<code>--kubeconfig</code> string	Path to the kubeconfig file to use for CLI requests.
<code>-n, --namespace</code> string	If present, the namespace scope for this CLI request
<code>--request-timeout</code> string	The length of time to wait before giving up on a single server request. Non-zero values should contain a corresponding time unit (e.g. 1s, 2m, 3h).
<code>-s, --server</code> string	The address and port of the Kubernetes API server
<code>--token</code> string	Bearer token for authentication to the API server
<code>--user</code> string	The name of the kubeconfig user

to use

2. Use `astrads [command] --help` for more information about a command.

```
kubectl astrads asup collect --help
```

Response:

Collect the autosupport bundle by specifying the component to collect. It will default to manual event.

Usage:

```
astrads asup collect [flags]
```

Examples:

```
# Control plane collection
```

```
kubectl astrads collect --component controlplane example1
```

```
# Storage collection for single node
```

```
kubectl astrads collect --component storage --nodes node1 example2
```

```
# Storage collection for all nodes
```

```
kubectl astrads collect --component storage --nodes all example3
```

```
# Collect but don't upload to support
```

```
kubectl astrads collect --component controlplane --local example4
```

NOTE:

```
--component storage and --nodes <name> are mutually inclusive.
```

```
--component controlplane and --nodes <name> are mutually exclusive.
```

Flags:

```
-c, --component string      Specify the component to collect:  
[storage , controlplane , vasaprovider, all]
```

```
-d, --duration int          Duration is the duration in hours from  
the startTime for collection  
of AutoSupport.
```

```
-e, --event string          Specify the callhome event to trigger.  
(default "manual")  
This should be a positive integer
```

```
-f, --forceUpload           Configure an AutoSupport to upload if  
it is in the compressed state  
and not  
uploading because it was created with
```

```

the 'local' option or if
disabled
    -h, --help            help for collect
    -l, --local            Only collect and compress the
autosupport bundle. Do not upload
to support.
bundle after it is in
    Use 'download' to copy the collected
the 'compressed' state
    Specify nodes to collect for storage
--nodes string            StartTime is the starting time for
component. (default "all")
    -t, --startTime string This should be in the ISO 8601 date
collection of AutoSupport.
time format.
    Example format accepted:
    2021-01-01T15:20:25Z, 2021-01-
01T15:20:25-05:00
    -u, --usermessage string UserMessage is the additional message
to include in the
AutoSupport subject.
CLI")                    (default "Manual event trigger from

```

Deploy a test application

Here are steps to deploy a test application that you can use with Astra Data Store.

In this example, we use a Helm repository to deploy a MongoDB chart from Bitnami.

What you'll need

- Astra Data Store cluster deployed and configured
- Trident installation completed

Steps

1. Add a Helm repo from Bitnami:

```
helm repo add bitnami https://charts.bitnami.com/bitnami
```

2. Deploy MongoDB:

```
helm install mongohelm4 --set persistence.storageClass=trident-csi
bitnami/mongodb --namespace=ns-mongodb --create-namespace
```

3. Check the status of the MongoDB pod:

```
~% kubectl get pods -n ns-mongodb
```

NAME	READY	STATUS	RESTARTS	AGE
mongodb-9846ff8b7-rfr4r	1/1	Running	0	67s

4. Verify the persistent volume claim (PVC) used by MongoDB:

```
~% kubectl get pvc -n ns-mongodb
```

NAME	STATUS	VOLUME	CAPACITY	ACCESS MODES
STORAGECLASS AGE				
mongodb	Bound	pvc-1133453a-e2f5-48a5	8Gi	RWO
trident-csi	97s			

5. List the volume by using the kubectl command `get astradsvolume`:

```
~% kubectl get astradsvolume pvc-1133453a-e2f5-48a5 -n astrads-system
```

NAME	SIZE	IP	CLUSTER	CREATED
pvc-1133453a-e2f5-48a5	8830116Ki	10.192.2.192	jai-ads	true

6. Describe the volume by using the kubectl command `describe astradsvolume`:

```
~% kubectl describe astradsvolume pvc-1133453a-e2f5-48a5 -n astrads-system
```

Name: pvc-1133453a-e2f5-48a5-a06c-d14b8aa7be07

Namespace: astrads-system

Manage the Astra Data Store cluster

You can manage the cluster by using kubectl commands with Astra Data Store.

- [Add a node](#)
- [Remove a node](#)
- [Place a node in maintenance mode](#)
- [Add drives to a node](#)
- [Replace a drive](#)

What you'll need

- System with kubectl and kubectl-astrads plugin installed. See [Install Astra Data Store](#).

Add a node

The node that you are adding should be part of the Kubernetes cluster and should have a configuration that is similar to the other nodes in the cluster.

To add a node using Astra Control Center, see [Add nodes to a storage backend cluster](#).

Steps

1. If the new node's dataIP is not already part of the Astra Data Store cluster CR, do the following:
 - a. Edit the cluster CR and add the additional dataIP in the `adsDataNetworks` **addresses** field. Replace the information in capital letters with the appropriate values for your environment:

```
kubectl edit astradscluster CLUSTER_NAME -n astrads-system
```

Response:

```
adsDataNetworks:
  -addresses: dataIP1,dataIP2,dataIP3,dataIP4,NEW_DATA_IP
```

- b. Save the CR.
- c. Add the node to the Astra Data Store cluster. Replace the information in capital letters with the appropriate values for your environment:

```
kubectl astrads nodes add --cluster CLUSTER_NAME
```

2. Otherwise, just add the nodes. Replace the information in capital letters with the appropriate values for your environment:

```
kubectl astrads nodes add --cluster CLUSTER_NAME
```

3. Verify that the node has been added:

```
kubectl astrads nodes list
```

Remove a node

Use `kubectl` commands with Astra Data Store to remove a node in a cluster.

Steps

1. List all the nodes:

```
kubectl astrads nodes list
```

Response:

NODE NAME	NODE STATUS	CLUSTER NAME
sti-rx2540-534d...	Added	cluster-multinodes-21209
sti-rx2540-535d...	Added	cluster-multinodes-21209
...		

2. Mark the node for removal. Replace the information in capital letters with the appropriate values for your environment:

```
kubectl astrads nodes remove NODE_NAME
```

Response:

```
Removal label set on node sti-rx2540-534d.lab.org
Successfully updated ADS cluster cluster-multinodes-21209 desired node
count from 4 to 3
```

After you mark the node for removal, the node status should change from active to present.

3. Verify the present status of the removed node:

```
kubectl get nodes --show-labels
```

Response:

NAME	STATUS	ROLES
sti-astramaster-050.lab.org v1.20.0 beta.kubernetes.io/arch=amd64,beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=sti-astramaster-050.lab.org,kubernetes.io/os=linux,node-role.kubernetes.io/control-plane=,node-role.kubernetes.io/master=	Ready	control-plane,master 3h39m
sti-rx2540-556a.lab.org v1.20.0 astrads.netapp.io/cluster=astrads-cluster-890c32c,astrads.netapp.io/storage-cluster-status=active,beta.kubernetes.io/arch=amd64,beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=sti-rx2540-556a.lab.org,kubernetes.io/os=linux,node-role.kubernetes.io/worker=true	Ready	worker 3h38m
sti-rx2540-556b.lab.org v1.20.0 astrads.netapp.io/cluster=astrads-cluster-890c32c,astrads.netapp.io/storage-cluster-status=active,beta.kubernetes.io/arch=amd64,beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=sti-rx2540-556b.lab.org,kubernetes.io/os=linux,node-role.kubernetes.io/worker=true	Ready	worker 3h38m
sti-rx2540-534d.lab.org v1.20.0 astrads.netapp.io/storage-cluster-status=present,astrads.netapp.io/storage-node-removal=,beta.kubernetes.io/arch=amd64,beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=sti-rx2540-557a.lab.org,kubernetes.io/os=linux,node-role.kubernetes.io/worker=true	Ready	worker 3h38m
sti-rx2540-557b.lab.org v1.20.0 astrads.netapp.io/cluster=astrads-cluster-890c32c,astrads.netapp.io/storage-cluster-status=active,beta.kubernetes.io/arch=amd64,beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=sti-rx2540-557b.lab.org,kubernetes.io/os=linux,node-role.kubernetes.io/worker=true	Ready	worker 3h38m

- Uninstall Astra Data Store from the node. Replace the information in capital letters with the appropriate values for your environment:

```
kubectl astrads nodes uninstall NODE_NAME
```

- Verify the node is removed from the cluster:

```
kubectl astrads nodes list
```

Result

The node is removed from Astra Data Store.

Place a node in maintenance mode

When you need to perform host maintenance or package upgrades, you should place the node in maintenance mode.

The node must already be part of the Astra Data Store cluster.

When a node is in maintenance mode, you cannot add a node to the cluster. In this example, we will place node nhcitjj1525 into maintenance mode.

Steps

1. Display the node details:

```
kubectl get nodes
```

Response:

NAME	STATUS	ROLES	AGE	VERSION
nhcitjj1525	Ready	<none>	3d18h	v1.20.0
nhcitjj1526	Ready	<none>	3d18h	v1.20.0
nhcitjj1527	Ready	<none>	3d18h	v1.20.0
nhcitjj1528	Ready	<none>	3d18h	v1.20.0
scs000039783-1	Ready	control-plane,master	3d18h	v1.20.0

2. Ensure that the node is not already in maintenance mode:

```
kubectl astrads maintenance list
```

Response (there are no nodes already in maintenance mode):

NAME	NODE NAME	IN MAINTENANCE	MAINTENANCE STATE	MAINTENANCE VARIANT
------	-----------	----------------	-------------------	---------------------

3. Enable maintenance mode. Replace the information in capital letters with the appropriate values for your environment:

```
kubectl astrads maintenance create CR_NAME --node-name=NODE_NAME  
--variant=Node
```

For example:

```
kubectl astrads maintenance create maint1 --node-name="nhcitjj1525"
--variant=Node
```

Response:

```
Maintenance mode astrads-system/maint1 created
```

4. List the nodes:

```
kubectl astrads nodes list
```

Response:

NODE NAME	NODE STATUS	CLUSTER NAME
nhcitjj1525	Added	ftap-astra-012
...		

5. Check the status of the maintenance mode:

```
kubectl astrads maintenance list
```

Response:

NAME	NODE NAME	IN MAINTENANCE	MAINTENANCE STATE
MAINTENANCE VARIANT			
node4	nhcitjj1525	true	ReadyForMaintenance
			Node

The In Maintenance mode starts as false and changes to true.

The Maintenance State changes from PreparingForMaintenance to ReadyforMaintenance.

6. After the node maintenance is complete, disable maintenance mode:

```
kubectl astrads maintenance update maint1 --node-name="nhcitjj1525"
--variant=None
```

7. Ensure that the node is no longer in maintenance mode:

```
kubectl astrads maintenance list
```

Add drives to a node

Use `kubectl` commands with Astra Data Store to add physical or virtual drives to a node in an Astra Data Store cluster.

What you'll need

- One or more drives that meet the following criteria:
 - Already installed in the node (physical drives) or added to the node VM (virtual drives)
 - No partitions on the drive
 - Drive is not currently in use by the cluster
 - Drive raw capacity does not exceed licensed raw capacity in the cluster (For example, with a license granting 2TB of storage per CPU core, a cluster of 10 nodes would have a maximum of 20TB raw drive capacity)
 - Drive is at least the size of other active drives in the node

Astra Data Store requires no more than 16 drives per node. If you try to add a 17th drive, the drive add request is denied.

Steps

1. Describe the cluster:

```
kubectl astrads clusters list
```

Response:

CLUSTER NAME	CLUSTER STATUS	NODE COUNT
cluster-multinodes-21209	created	4

2. Note the cluster name.
3. Show the drives that are available to add to all nodes in the cluster. Replace `CLUSTER_NAME` with the name of your cluster:

```
kubectl astrads drives adddrive show-available --cluster=CLUSTER_NAME
```

Response:

```

Node: node1.name
Add drive maximum size: 100.0 GiB
Add drive minimum size: 100.0 GiB
NAME IDPATH SERIAL PARTITIONCOUNT SIZE ALREADYINCLUSTER
sdg /dev/disk/by-id/scsi-3c290e16d52479a9af5eac c290e16d52479a9af5eac 0
100 GiB false
sdh /dev/disk/by-id/scsi-3c2935798df68355dee0be c2935798df68355dee0be 0
100 GiB false

Node: node2.name
Add drive maximum size: 66.7 GiB
Add drive minimum size: 100.0 GiB
No suitable drives to add exist.

Node: node3.name
Add drive maximum size: 100.0 GiB
Add drive minimum size: 100.0 GiB
NAME IDPATH SERIAL PARTITIONCOUNT SIZE ALREADYINCLUSTER
sdg /dev/disk/by-id/scsi-3c29ee82992ed7a36fc942 c29ee82992ed7a36fc942 0
100 GiB false
sdh /dev/disk/by-id/scsi-3c29312aa362469fb3da9c c29312aa362469fb3da9c 0
100 GiB false

Node: node4.name
Add drive maximum size: 66.7 GiB
Add drive minimum size: 100.0 GiB
No suitable drives to add exist.

```

4. Do one of the following:

- If all available drives have the same name, you can add them to the respective nodes simultaneously. Replace the information in capital letters with the appropriate values for your environment:

```
kubect1 astrads drives adddrive create --cluster=CLUSTER_NAME --name
REQUEST_NAME --drivesbyname all=DRIVE_NAME
```

- If the drives are named differently, you can add them to the respective nodes one at a time (you'll need to repeat this step for each drive you need to add). Replace the information in capital letters with the appropriate values for your environment:

```
kubect1 astrads drives adddrive create --cluster=CLUSTER_NAME --name
REQUEST_NAME --drivesbyname NODE_NAME=DRIVE_NAME
```

Result

Astra Data Store creates a request to add the drive or drives, and a message appears with the result of the request.

Replace a drive

When a drive fails in a cluster, the drive must be replaced as soon as possible to ensure data integrity. If a drive fails, you can see information about the failed drive in cluster CR node status, cluster health condition information, and the metrics endpoint. You can use the following example commands to see failed drive information.

Example of cluster showing failed drive in nodeStatuses.driveStatuses

```
kubectl get adscl -A -o yaml
```

Response:

```
...
apiVersion: astrads.netapp.io/v1alpha1
kind: AstraDSCluster
...
nodeStatuses:
  - driveStatuses:
    - driveID: 31205e51-f592-59e3-b6ec-185fd25888fa
      driveName: scsi-36000c290ace209465271ed6b8589b494
      drivesStatus: Failed
    - driveID: 3b515b09-3e95-5d25-a583-bee531ff3f31
      driveName: scsi-36000c290ef2632627cb167a03b431a5f
      drivesStatus: Active
    - driveID: 0807fa06-35ce-5a46-9c25-f1669def8c8e
      driveName: scsi-36000c292c8fc037c9f7e97a49e3e2708
      drivesStatus: Active
  ...
```

Example of new AstraDSFailedDrive CR

The failed drive CR is created automatically in the cluster with a name corresponding to the UUID of the failed drive.

```
kubectl get adsfd -A -o yaml
```

Response:

```
...
apiVersion: astrads.netapp.io/v1alpha1
kind: AstraDSFailedDrive
metadata:
  name: c290a-5000-4652c-9b494
  namespace: astrads-system
spec:
  executeReplace: false
  replaceWith: ""
status:
  cluster: arda-6e4b4af
  failedDriveInfo:
    failureReason: AdminFailed
    inUse: false
    name: scsi-36000c290ace209465271ed6b8589b494
    path: /dev/disk/by-id/scsi-36000c290ace209465271ed6b8589b494
    present: true
    serial: 6000c290ace209465271ed6b8589b494
    node: sti-rx2540-300b.lab.org
  state: ReadyToReplace
```

```
kubectl astrads faileddrive list --cluster arda-6e4b4af
```

Response:

NAME	NODE	CLUSTER	STATE
AGE			
6000c290	sti-rx2540-300b.lab.netapp.com	ard-6e4b4af	ReadyToReplace
13m			

Steps

1. List possible replacement drives with the `kubectl astrads faileddrive show-replacements` command, which filters drives that fit replacement restrictions (unused in cluster, not mounted, no partitions, and equal or larger than failed drive).

To list all drives without filtering possible replacement drives, add `--all` to `show-replacements` command.

```
kubectl astrads faileddrive show-replacements --cluster ard-6e4b4af
--name 6000c290
```

Response:

NAME	IDPATH	SERIAL	PARTITIONCOUNT	MOUNTED	SIZE
sdh	/scsi-36000c29417	45000c	0	false	100GB

2. Use the `replace` command to replace the drive with the passed serial number. The command completes the replacement or fails if `--wait` time elapses.

```
kubectl astrads faileddrive replace --cluster arda-6e4b4af --name
6000c290 --replaceWith 45000c --wait
Drive replacement completed successfully
```

If `kubectl astrads faileddrive replace` is executed using an inappropriate `--replaceWith` serial number, an error appears similar to this:

```
kubectl astrads replacedrive replace --cluster astrads-cluster-f51b10a
--name 6000c2927 --replaceWith BAD_SERIAL_NUMBER
Drive 6000c2927 replacement started
Failed drive 6000c2927 has been set to use BAD_SERIAL_NUMBER as a
replacement
...
Drive replacement didn't complete within 25 seconds
Current status: {FailedDriveInfo:{InUse:false Present:true Name:scsi-
36000c2 FiretapUUID:444a5468 Serial:6000c Path:/scsi-36000c
FailureReason:AdminFailed Node:sti-b200-0214a.lab.netapp.com}
Cluster:astrads-cluster-f51b10a State:ReadyToReplace
Conditions:[{Message: "Replacement drive serial specified doesn't
exist", Reason: "DriveSelectionFailed", Status: False, Type:' Done'}]}
```

3. To re-run drive replacement use `--force` with the previous command:

```
kubectl astrads replacedrive replace --cluster astrads-cluster-f51b10a
--name 6000c2927 --replaceWith VALID_SERIAL_NUMBER --force
```

For more information

Monitor Astra Data Store

Monitor metrics with Cloud Insights

You can monitor Astra Data Store metrics using Cloud Insights.

Here are some sample Astra Data Store metrics displayed in Cloud Insights:

You can also display a list of metrics generated in Astra Data Store by using the [Open Metrics API help](#).

You can complete the following tasks:

- [Complete Cloud Insights connection prerequisite tasks](#)
- [Acquisition Unit storage](#)
- [Download and run the installation script](#)
- [Edit the Cloud Insights connection](#)
- [Disconnect from Cloud Insights](#)

Complete Cloud Insights connection prerequisite tasks

Prior to connecting Astra Data Store with Cloud Insights, you need to complete these tasks:

- [Install the Astra Data Store Monitoring Operator](#) that is part of the Astra Data Store installation instructions.
- [Install the kubectl-astrads binary](#) that is part of the Astra Data Store installation instructions.
- [Create a Cloud Insights account](#).
- Ensure that the following commands are available: `awk`, `curl`, `grep` and `jq`

Gather the following information:

- **Cloud Insights API access token** with Read/Write permissions to the categories: Acquisition Unit, Data Collection, Data Ingestion and Log Ingestion. This will be used for the read/write operations, setting up the Acquisition Unit, and setting up data ingest processes.
- **Kubernetes API server IP address and port**. This is used to monitor the Astra Data Store cluster.
- **Kubernetes API token**. This is used to call Kubernetes APIs.
- **Persistent volume configuration**. Information about how persistent volumes are provisioned.

Acquisition Unit storage

The Acquisition Unit requires three persistent volumes for storing installation files, configuration data and logs. The Monitoring Operator uses the default storage class to create persistent volume claims. You can specify a different storage class name using the `-s` option when running the installer script.

If your Kubernetes cluster does not have a storage provisioner (such as NetApp Trident), you can provide a local filesystem path using the `-r` option when running the installer script. When the `-r` option is set, the installer script creates three persistent volumes inside the provided directory. This directory requires a minimum of 150 GB free space.

Download and run the installation script

Cloud Insights provides a Bash script to enable Astra Data Store monitoring via the Monitoring Operator. The install script will install an Acquisition Unit with the Astra Data Store collector and a Fluent Bit agent.

The Cloud Insights tenant domain name and selected Cloud Insights API access token will be embedded in the installer script when it is downloaded.

Then, metrics will be sent as follows:

- The Cloud Insights Acquisition Unit will send metrics to the Cloud Insights data lake.
- Fluent Bit will send logs to the log ingestion service.

Display installer script help

The full help text for the installer script is shown below:

Display installer script help text:

```
./cloudinsights-ads-monitoring.sh -h
```

Response:

```

USAGE: cloudinsights-ads-monitoring.sh [OPTIONS]
Configure monitoring of Astra Data Store by Cloud Insights.
OPTIONS:
  -h                                Display this help message.
  -d ci_domain_name                 Cloud Insights tenant domain name.
  -i kubernetes_ip                 Kubernetes API server IP address.
  -k ci_api_key                     Cloud Insights API Access Token.
  -n namespace                      Namespace for monitoring components. (default:
netapp-monitoring)
  -p kubernetes_port               Kubernetes API server port. (default: 6443)
  -r root_pv_dir                   Create 3 Persistent Volumes in this directory
for the Acquisition Unit.
                                   Only specify this option if there is no Storage
Provisioner installed and the PVs do not already exist.
  -s storage_class                 Storage Class name for provisioning Acquisition
Unit PVs. If not specified, the default storage class will be used.
  -t kubernetes_token              Kubernetes API server token.

```

Run the install script

1. Create a Cloud Insights account, if you don't already have one.
2. Log in to Cloud Insights.
3. From the Cloud Insights menu, click on **Admin > Data Collectors**.
4. Click on **+ Data Collector** to add a new collector.

5. Click on the **Astra Data Store** tile.
6. Select the correct Cloud Insights API access token or create a new one.
7. Follow the instructions to download the installer script, update the permissions, and run the script.

The script contains your Cloud Insights tenant URL and the selected Cloud Insights API access token.

Select a Data Collector

Configure Collector

NetApp
Astra Data Store

Configure Collector

Configure Kubernetes Operator to monitor NetApp Astra Data Store (ADS).

What Operating System or Platform Are You Using?

Kubernetes

Select existing API Access Token or create a new one

[+ API Access Token](#)

[Production Best Practices ?](#)

Configure Astra Data Store [Need Help?](#)

- 1

The commands *awk*, *curl*, *grep*, *jq*, *kubect*l and the *kubect*l-*astrads* plugin must be installed where the installer script is run. You will need the Kubernetes API server IP address and a Kubernetes API token to run this install script. See the documentation if you need help finding this information.
- 2

Copy Installer Script

☐ Reveal Installer Script

```
#!/usr/bin/env bash
SCRIPT='basename $0'

CI_DOMAIN_NAME="f49uaky.gstabler-ads.cloudinsights-dev.netapp.com"
CI_API_KEY="eyJraWQ1OiI5OTk5IiwidHlwIjoI5ldUIiwiaWxnIjoI5FMzODQifQ.eyJjcVhdG9yTG9naW41OiJhZG1pb2IiImRpc3BsYXl0YW11IjoIZGVmYXVsdF9hZHNfYXBPX2tleTEgKG9uIGJlaGFsZiBvZiBhZG1pb2I"

```
- 3

Copy the above installer script and save it as *cloudinsights-ads-monitoring.sh*
- 4

Copy Permissions Command

☐ Reveal Permissions Command

```
chmod +x cloudinsights-ads-monitoring.sh

```
- 5

Paste the permissions command in a terminal to enable execute permissions on the installer script.
- 6

Copy Install Command

☐ Reveal Install Command

```
./cloudinsights-ads-monitoring.sh -i <KUBERNETES_IP> -t <KUBERNETES_TOKEN>

```
- 7

Paste the install command in a terminal, replace the placeholders with the correct values for your environment, and run the command. It will take several minutes to complete. The script will use the default namespace 'netapp-monitoring'. Additional options are available for customized environments. The default configuration for kubectl should point to the kubernetes cluster to be monitored.
- 8

Complete Setup

8. Click **Complete Setup** after the script completes.

After the installation script completes, the Astra Data Store collector appears in the Datasources list.

If the script exits due to an error, you can run it again later once the error is resolved. The script supports additional parameters such as the Monitoring Operator namespace and Kubernetes API server port if your environment does not use the default settings. Use the `-h` option in `./cloudinsights-ads-monitoring.sh -h` to see the usage and help text.

The installation script produces output that looks like this when the configuration is successful:

```
Configuring Cloud Insights monitoring for Astra Data Store . . .
Configuring monitoring namespace
...
Configuring output sink and Fluent Bit plugins
Configuring Acquisition Unit
...
Acquisition Unit has been installed successfully.
Configuring Astra Data Store data collector
Astra Data Store collector data '<CLUSTER_NAME>' created
Configuration done!
```

Example Agent CR

Below is an example of what the `monitoring-netapp` agent CR will look like after running the installer script.

```

spec:
  au:
    isEnabled: true
    storageClassName: auto-sc
  cluster-name: meg-ads-21-22-29-30
  docker-repo: docker.repo.eng.netapp.com/global/astra
  fluent-bit:
    - name: ads-tail
      outputs:
        - sink: ADS_STDOUT
      substitutions:
        - key: TAG
          value: firetapems
        - key: LOG_FILE
          values:
            - /var/log/firetap/*/ems/ems
            - /var/log/firetap/ems/*/ems/ems
        - key: ADS_CLUSTER_NAME
          value: meg-ads-21-22-28-29-30
    - name: agent
    - name: ads-tail-ci
      outputs:
        - sink: CI
      substitutions:
        - key: TAG
          value: netapp.ads
        - key: LOG_FILE
          values:
            - /var/log/firetap/*/ems/ems
            - /var/log/firetap/ems/*/ems/ems
        - key: ADS_CLUSTER_NAME
          value: meg-ads-21-22-28-29-30
  output-sink:
    - api-key: abcd
      domain-name: bz19ngz.gst-adsdemo.ci-dev.netapp.com
      name: CI
  serviceAccount: sa-netapp-monitoring
  status:
    au-pod-status: UP
    au-uuid: eddeccc6-3aa3-4dd2-a98c-220085fae6a9

```

Edit the Cloud Insights connection

You can later edit the Kubernetes API token or the Cloud Insights API access token:

- If you want to update Kubernetes API token, you should edit the Astra Data Store collector from the Cloud Insights UI.
- If you want to update the Cloud Insights API access token used for telemetry and logs, you should edit the Monitoring Operator CR using kubectl commands.

Update the Kubernetes API token

1. Log in to Cloud Insights.
2. Select **Admin > Data Collectors** to access the Data Collectors page.
3. Find the entry for the Astra Data Store cluster.
4. Click on the menu on the right side of the page, and select **Edit**.
5. Update the Kubernetes API Token field with the new value.
6. Select **Save Collector**.

Update the Cloud Insights API access token

1. Log in to Cloud Insights.
2. Create a new Cloud Insights API access token by selecting **Admin > API Access** and clicking **+API Access Token**.
3. Edit the Agent CR:

```
kubectl --namespace netapp-monitoring edit agent agent-monitoring-netapp
```

4. Locate the `output-sink` section and find the entry with the name `CI`.
5. For the label `api-key`, replace the current value with the new Cloud Insights API access token.

The section looks something like this:

```
output-sink:
  - api-key: <api key value>
    domain-name: <tenant url>
    name: CI
```

6. Save and quit the editor window.

The Monitoring Operator will update Fluent Bit to use the new Cloud Insights API access token.

Disconnect from Cloud Insights

To disconnect from Cloud Insights, you will need to delete the Astra Data Store collector from the Cloud Insights UI first. After that is complete, you can remove the Acquisition Unit, Telegraf (if configured) and Fluent Bit configurations from the Monitoring Operator.

Remove the Astra Data Store collector

1. Log in to Cloud Insights.

2. Select **Admin > Data Collectors** to access the Data Collectors page.
3. Find the entry for the Astra Data Store cluster.
4. Select the menu on the right side of the screen, and select **Delete**.
5. Click **Delete** on the confirmation page.

Remove the Acquisition Unit, Telegraf (if configured) and Fluent Bit

1. Edit the Agent CR:

```
kubectl --namespace netapp-monitoring edit agent agent-monitoring-netapp
```

2. Locate the `au` section and set `isEnabled` to `false`
3. Locate the `fluent-bit` section and remove the plugin named `ads-tail-ci`. If there are no more plugins, you can remove the `fluent-bit` section.
4. If Telegraf is configured, locate the `telegraf` section and remove the plugin named `ads-open-metric`. If there are no more plugins, you can remove the `telegraf` section.
5. Locate the `output-sink` section and remove the sink named `CI`.
6. Save and quit the editor window.

The Monitoring Operator will update the Telegraf (if configured) and Fluent Bit configurations and delete the Acquisition Unit pod.

7. If you used local directories for the Acquisition Unit PVs instead of a Storage Provisioner, delete the PVs:

```
kubectl delete pv au-lib au-log au-pv
```

Then, delete the actual directories on the node where the Acquisition Unit was running.

8. After the Acquisition Unit pod has been deleted, you can delete the Acquisition Unit from Cloud Insights.
 - a. In the Cloud Insights menu, select **Admin > Data Collectors**.
 - b. Click on the **Acquisition Units** tab.
 - c. Click on the menu next to the Acquisition Unit pod.
 - d. Select **Delete**.

The Monitoring Operator updates the Telegraf (if configured) and Fluent Bit configurations and removes the Acquisition Unit.

Open Metrics API help

Here is a list of APIs that you can use to gather metrics from Astra Data Store.

- The "HELP" line describes the metric.
- The "TYPE" line indicates whether the metric is a gauge or a counter.

```

# HELP astrads_cluster_capacity_logical_percent Percentage cluster logical
capacity that is used (0-100)
# TYPE astrads_cluster_capacity_logical_percent gauge
# HELP astrads_cluster_capacity_max_logical Max Logical capacity of the
cluster in bytes
# TYPE astrads_cluster_capacity_max_logical gauge
# HELP astrads_cluster_capacity_max_physical The sum of the space in the
cluster in bytes for storing data after provisioning efficiencies, data
reduction algorithms and replication schemes are applied
# TYPE astrads_cluster_capacity_max_physical gauge
# HELP astrads_cluster_capacity_ops The IO operations capacity of the
cluster
# TYPE astrads_cluster_capacity_ops gauge
# HELP astrads_cluster_capacity_physical_percent The percentage of cluster
physical capacity that is used (0-100)
# TYPE astrads_cluster_capacity_physical_percent gauge
# HELP astrads_cluster_capacity_used_logical The sum of the bytes of data
in all volumes in the cluster before provisioning efficiencies, data
reduction algorithms and replication schemes are applied
# TYPE astrads_cluster_capacity_used_logical gauge
# HELP astrads_cluster_capacity_used_physical Used Physical capacity of a
cluster in bytes
# TYPE astrads_cluster_capacity_used_physical gauge
# HELP astrads_cluster_other_latency The sum of the accumulated latency in
seconds for other IO operations of all the volumes in a cluster. Divide by
astrads_cluster_other_ops to get the average latency per other operation
# TYPE astrads_cluster_other_latency counter
# HELP astrads_cluster_other_ops The sum of the other IO operations of all
the volumes in a cluster
# TYPE astrads_cluster_other_ops counter
# HELP astrads_cluster_read_latency The sum of the accumulated latency in
seconds of read IO operations of all the volumes in a cluster. Divide by
astrads_cluster_read_ops to get the average latency per read operation
# TYPE astrads_cluster_read_latency counter
# HELP astrads_cluster_read_ops The sum of the read IO operations of all
the volumes in a cluster
# TYPE astrads_cluster_read_ops counter
# HELP astrads_cluster_read_throughput The sum of the read throughput of
all the volumes in a cluster in bytes
# TYPE astrads_cluster_read_throughput counter
# HELP astrads_cluster_storage_efficiency Efficacy of data reduction
technologies. (logical used / physical used)
# TYPE astrads_cluster_storage_efficiency gauge
# HELP astrads_cluster_total_latency The sum of the accumulated latency in
seconds of all IO operations of all the volumes in a cluster. Divide by
astrads_cluster_total_ops to get average latency per operation

```

```

# TYPE astrads_cluster_total_latency counter
# HELP astrads_cluster_total_ops The sum of the IO operations of all the
volumes in a cluster
# TYPE astrads_cluster_total_ops counter
# HELP astrads_cluster_total_throughput The sum of the read and write
throughput of all the volumes in a cluster in bytes
# TYPE astrads_cluster_total_throughput counter
# HELP astrads_cluster_utilization_factor The ratio of the current cluster
IO operations based on recent IO sizes to the cluster iops capacity. (0.0
- 1.0)
# TYPE astrads_cluster_utilization_factor gauge
# HELP astrads_cluster_volume_used The sum of used capacity of all the
volumes in a cluster in bytes
# TYPE astrads_cluster_volume_used gauge
# HELP astrads_cluster_write_latency The sum of the accumulated latency in
seconds of write IO operations of all the volumes in a cluster. Divide by
astrads_cluster_write_ops to get the average latency per write operation
# TYPE astrads_cluster_write_latency counter
# HELP astrads_cluster_write_ops The sum of the write IO operations of all
the volumes in a cluster
# TYPE astrads_cluster_write_ops counter
# HELP astrads_cluster_write_throughput The sum of the write throughput of
all the volumes in a cluster in bytes
# TYPE astrads_cluster_write_throughput counter
# HELP astrads_disk_base_seconds Base for busy, pending and queued.
Seconds since collection began
# TYPE astrads_disk_base_seconds counter
# HELP astrads_disk_busy Seconds the disk was busy. 100 *
(astrads_disk_busy / astrads_disk_base_seconds) = percent busy (0-100)
# TYPE astrads_disk_busy counter
# HELP astrads_disk_capacity Raw Capacity of a disk in bytes
# TYPE astrads_disk_capacity gauge
# HELP astrads_disk_io_pending Summation of the count of pending io
operations for a disk times time. Divide by astrads_disk_base_seconds to
get the average pending operation count
# TYPE astrads_disk_io_pending counter
# HELP astrads_disk_io_queued Summation of the count of queued io
operations for a disk times time. Divide by astrads_disk_base_seconds to
get the average queued operations count
# TYPE astrads_disk_io_queued counter
# HELP astrads_disk_read_latency Total accumulated latency in seconds for
disk reads. Divide by astrads_disk_read_ops to get the average latency per

```

Monitor metrics with Prometheus and Grafana

You can monitor Astra Data Store metrics with Prometheus and Grafana. You can configure Prometheus to gather metrics from the Astra Data Store Kubernetes cluster metrics endpoint, and you can use Grafana to visualize the metrics data.

What you'll need

- Make sure that you have downloaded and installed the Prometheus and Grafana packages on the Astra Data Store cluster or a different cluster that can communicate with the Astra Data Store cluster. Follow the instructions in the official documentation to install each tool:
 - [Install Prometheus](#)
 - [Install Grafana](#)
- Prometheus and Grafana need to be able to communicate with the Astra Data Store Kubernetes cluster. If Prometheus and Grafana are not installed on the Astra Data Store cluster, you need to make sure they can communicate with the metrics service running on the Astra Data Store cluster.

Configure Prometheus

Astra Data Store exposes a metrics service on TCP port 9341 in the Kubernetes cluster. You need to configure Prometheus to collect metrics from this service.

Steps

1. Edit the `prometheus.yml` configuration file for your Prometheus installation.
2. Add a service target that points to the Astra Data Store service name and its port. For example:

```
scrape_configs:
static_configs:
- targets: ['astrads-metrics-service.astrads-system:9341']
```

3. Start the Prometheus service.

Configure Grafana

You can configure Grafana to display the metrics collected by Prometheus.

Steps

1. Edit the `datasources.yml` configuration file for your Grafana installation.
2. Add Prometheus as a data source. For example:

```
apiVersion: 1

datasources:
- name: astradatastore-prometheus
  type: prometheus
  access: proxy
  url: http://localhost:9090
  jsonData:
    manageAlerts: false
```

3. Start the Grafana service.
4. Follow the instructions in the Grafana documentation to [get started](#).

Import Grafana dashboard templates

The bundle file you downloaded to install Astra Data Store includes Grafana dashboard template files that you can import from within Grafana. These dashboard templates can help you see the types of metrics that are available from Astra Data Store and how you can view them.

Steps

1. Open the Astra Data Store `.tar.gz` bundle.
2. Open the `manifests` directory.
3. Extract the `grafana_cluster.json` and `grafana_volume.json` files.

- Using the Grafana web UI, [import the dashboard template files in to Grafana](#).

Configure and monitor event logs

To monitor Event Management System (EMS) logs, you can do the following high level tasks:

- [Configure monitoring in the Astra Data Store cluster custom resource \(CR\)](#)
- [Set up Cloud Insights](#)
- [Stream event logs to Elastic](#).

Configure monitoring in the Astra Data Store cluster custom resource (CR)

If the monitoring option has not been configured on the Astra Data Store cluster CR, you can set it up using `astrads` extensions.

Enter:

```
kubectl astrads monitoring setup -n <NAMESPACE OF AGENT INSTALLED> -r  
<DOCKER REPO TO FIND FLUENT/TELEGRAF ETC IMAGES>
```

where:

- Namespace of agent installed: Enter the namespace for the Monitoring agent, which is the default name of the monitoring-netapp CR for the Monitoring Operator.
- `-r` is optional to set up the Docker registry where the Fluent or Telegraf images are located. By default, the path is set to `docker.repo.eng.netapp.com/global/astra`, which you can change.

Set up Cloud Insights

To view the logs, setting up Cloud Insights is optional; however, it is helpful to view data using Cloud Insights. See [how to set up NetApp Cloud Insights](#) for use with Astra Data Store.

Stream event logs to Elastic

To stream EMS events and other pod logs to a third-party endpoint such as Elastic, use the `astrads` extensions.

Enter:

```
kubectl astrads monitoring --host <ELASTIC HOST NAME> --port <ELASTIC HOST  
PORT> es
```

The Elastic host name can be an IP address.

Secure Astra Data Store

Manage security certificates

Astra Data Store uses Mutual Transport Layer Security (mTLS) encryption between the cluster's software components. Each Astra Data Store cluster has a self-signed root CA certificate (`astrads-cert-root`) and an intermediate CA certificate (`astrads-cert-<cluster_name>`).

These certificates are managed by the Astra Data Store operator; the operator automatically renews each certificate 7 days before their expiration date. You can also revoke the certificates manually.

Revoke a certificate

If an Astra Data Store controller, node, or CA certificate is compromised, you can revoke it by deleting its mTLS secret. When you do this, the Astra Data Store operator automatically issues a new certificate. You can revoke an Astra Data Store certificate at any time.

If you revoke a CA certificate, this will revoke any certificates signed by that CA.

Steps

1. Log in to the controller node in the Astra Data Store cluster.
2. List the existing certificates on the system. For example:

```
kubectl get secrets -n astrads-system | grep astrads-cert
```

The output should be similar to the following:

```
astrads-cert-astrads-cluster-controller
kubernetes.io/tls      4      6d6h
astrads-cert-astrads-cluster-f23d158
kubernetes.io/tls      4      6d6h
astrads-cert-astrads-ds-dms-astrads-cluster-f23d158
kubernetes.io/tls      4      6d6h
astrads-cert-astrads-ds-support-astrads-cluster-f23d158
kubernetes.io/tls      4      6d6h
astrads-cert-astrads-support-astrads-cluster-f23d158
kubernetes.io/tls      4      6d6h
astrads-cert-root
kubernetes.io/tls      4      6d6h
astrads-cert-sti-net-com
kubernetes.io/tls      5      6d6h
```

3. In the output, note the name of the certificate you need to revoke.
4. Use the `kubectl` utility to revoke the certificate, replacing `CERTIFICATE_NAME` with the name of the certificate. For example:

```
kubectl delete secret CERTIFICATE_NAME -n astrads-system
```

Result

The existing certificate is revoked, and a new certificate is automatically generated in its place.

Manage external keys

You can use one or more external key management servers to secure the keys that the cluster uses to access encrypted data. An external key management server is a third-party system in your storage environment that serves keys to nodes using the Key Management Interoperability Protocol (KMIP).

Astra Data Store enables Software Encryption at Rest (SEAR) with an internal key provider by default when the Astra Data Store cluster is created.

Managing keys involves the following custom resource definitions (CRDs):

- **AstraDSKeyProvider**: Configures an external KMIP server, which could be a cluster of servers.
- **AstraDSSEARKeyRotate**: Gets a new key encryption key from the key provider and provides it to Astra Data Store.

You can perform the following tasks related to external key management:

- [Set up external key management](#)
- [Check the software encryption at rest status](#)
- [Change external to internal key management](#)
- [Rotate keys for security](#)

Set up external key management

Setting up external key management in Astra Data Store uses `kubectl astrads` commands.

What you'll need

You will need an SSL certificate on the cluster or KMIP server that enables you to set up external keys, for example, by using OpenSSL.

Steps

1. Prepare the certificate for the key provider client. Include the client certificate, client private key, and trust CA bundles.

You'll prepare the SSL certificate on the cluster or KMIP server that allows you to set up external keys, for example, by using OpenSSL.

2. Log in to one of the nodes in the Astra Data Store cluster.
3. Configure the key provider for the Astra Data Store cluster by entering the following `kubectl` extension command:

```
kubectl-astrads key-provider certs --key key.pem
--client-cert client_cert.pem --ca-cert server_ca.pem
--hostnames=<kmip_server_ip> <key_provider_cr_name>
--namespace astrads-system --cluster <ads_cluster_name>
```

Example

The following example configures an external key provider named "hashicorp" for ADS Cluster "astrads-cluster-f23d158".

```
kubectl-astrads key-provider certs --key key.pem
--client-cert client_cert.pem --ca-cert server_ca.pem
--hostnames=10.235.nnn.nnn hashicorp
--namespace astrads-system --cluster astrads-cluster-f23d158
```

1. Configure the Astra Data Store cluster to use an external key manager for SEAR via the AstraDSCluster CR. Display the help.

```
kubectl-astrads clusters sears -h
```

Response:

Configure SEARS in AstraDS cluster

Usage:

```
astrads clusters sears [flags]
```

Flags:

```
-d, --duration string    Duration for key rotation (default "2160h")
-h, --help              help for sears
```

Global Flags:

```
--ads-cluster-name string    Name of the ADS Cluster
--ads-cluster-namespace string  Namespace of the ADS Cluster
...
```

Example

The following command configures the Astra Data Store cluster to use `AstraDSKeyProvider hashicorp` as the key manager of SEAR. The command also uses the key rotate time, which has the default value of 90 days (2160 hours).

```
kubectl-astrads clusters sears -d 500h hashicorp
--ads-cluster-name=astrads-cluster-f23d158
--ads-cluster-namespace=astrads-system
```

Check the software encryption at rest status

You can check the configuration of the software encryption at rest.

Step

1. Inspect the AstraDSCluster CR.

```
Name:          astrads-cluster-f23d158
Namespace:     astrads-system
Labels:        <none>
Annotations:   <none>
API Version:   astrads.netapp.io/v1beta1
Kind:          AstraDSCluster
...
Spec:
...
  Software Encryption At Rest:
    Ads Key Provider:      hashicorp
    Key Rotation Period:   500h0m0s
...
Status:
...
  Software Encryption At Rest Status:
    Key Active Time:       2022-05-16T15:53:47Z
    Key Provider Name:     hashicorp
    Key Provider UUID:     ccfc2b0b-dd98-5ca4-b778-99debef83550
    Key UUID:              nnnnnnnn-nnnn-nnnn-nnnn-nnnnnnnnnnnnn
```

Change external to internal key management

If you are currently using an external key manager, you can change it to an internal key manager.

Steps

1. Change the AstraDSCluster CR by removing the SoftwareEncryptionAtRest configuration.
2. (Optional) Delete the previous AstraDSKeyProvider and associated secret.

The previous key provider and secret will not be removed automatically.

Rotate keys for security

Key rotation enhances security. By default, Astra Data Store rotates keys automatically every 90 days. You can change the default setting. Additionally, you can rotate keys on demand when you want.

Configure automatic key rotation

1. Update the AstraDSSEARKeyRotate parameter in the CRD.

```
kubectl patch astradscluster astrads-cluster-f23d158
-n astrads-system
--type=merge -p '{"spec": {"softwareEncryptionAtRest": {
"keyRotationPeriod": "3000h"}}}'
```

Configure on-demand key rotation

1. Create an AstraDSSEARKeyRotateRequest CR to rotate keys.

```
cat << EOF | kubectl apply -f -
apiVersion: astrads.netapp.io/v1beta1
kind: AstraDSSEARKeyRotateRequest
metadata:
  name: manual
  namespace: astrads-system
spec:
  cluster: astrads-cluster-f23d158
EOF
```

Update the Astra Data Store license

You can update the installed evaluation license for Astra Data Store to extend the evaluation period. You can update the license using one of three methods:

- To update the Astra Data Store license using Astra Control Center, see [Update a storage backend license](#).
- To update the Astra Data Store license using the Astra VMware Plugin, see [Manage Astra Data Store with VMware](#).
- To update the Astra Data Store license using the command line, see [Update the Astra Data Store license using the command line](#).

Update the Astra Data Store license using the command line

You can use the `kubectl` utility to update the Astra Data Store license.

Steps

1. Apply the replacement NetApp License File (NLF) that you obtained from NetApp. Before you run the command, enter the name of the cluster (`<Astra-Data-Store-cluster-name>`) and the path to the license file (`<file_path/file.txt>`):

```
kubectl astrads license add --license-file-path <file_path/file.txt>
--ads-cluster-name <Astra-Data-Store-cluster-name> -n astrads-system
```

2. Verify that the license has been added:

```
kubectl astrads license list
```

You should see a response similar to the following:

NAME	ADSCLUSTER	VALID	PRODUCT
EVALUATION	ENDDATE	VALIDATED	
p100000006	astrads-example-cluster	true	Astra Data Store
2023-01-23	2022-04-04T14:38:54Z		true

Upgrade Astra Data Store

You can upgrade Astra Data Store to take advantage of the latest features and fixes. You can upgrade Astra Data Store by using the Astra Data Store `kubectl` extension.

Upgrade Astra Data Store using `kubectl`

You can use the Astra Data Store `kubectl` extension to upgrade Astra Data Store.

Download the Astra Data Store bundle and extract the images

Steps

1. Log in to the [NetApp Support Site](#) and download the Astra Data Store bundle (Astra_Data_Store_2022.05.tar).
2. (Optional) Use the following command to verify the signature of the bundle:

```
openssl dgst -sha256 -verify Astra_Data_Store_2022.05.pub -signature  
Astra_Data_Store_2022.05.sig 2022.12.01_ads.tar
```

3. Create a directory:

```
mkdir Astra_Data_Store_2022.05  
cd Astra_Data_Store_2022.05
```

4. Extract the images:

```
tar -vxzf <path to tar file>/Astra_Data_Store_2022.05.tar
```

The images will be extracted to a `astrads/images` directory created within the working directory.

Copy the binary and push images to your local registry

Steps

1. Copy the kubectl-astrads binary from the directory you used to extract images to the standard path where Kubernetes kubectl binaries are installed (/usr/bin/ is used as the path in the example below). kubectl-astrads is a custom kubectl extension that installs and manages Astra Data Store clusters.

Use the `which kubectl` command to find the path where kubectl binaries are installed.

```
cp -p .astrads/bin/kubectl-astrads /usr/bin/.
```

2. Add the files in the Astra Data Store image directory to your local registry.

See a sample script for the automatic loading of images below.

- a. Log in to your registry:

```
docker login [your_registry_path]
```

- b. Set an environment variable to the registry path where you want to push the Astra Data Store images; for example, `repo.company.com`.

```
export REGISTRY=repo.company.com/astrads
```

- c. Run the following script to load the images into Docker, tag the images, and push the images to your local registry:

```
for astraImageFile in $(ls astrads/images/*.tar) ; do
    astraImage=$(docker load --input ${astraImageFile} | sed 's~Loaded
image(s): ~~')
    astraImageShort=`echo $astraImage | sed 's~.*/~~'`
    docker tag ${astraImage} ${REGISTRY}/${astraImageShort}
    docker push ${REGISTRY}/${astraImageShort}
done
sed -i 's~\[YOUR_REGISTRY\]~'\${REGISTRY}'~'
./astrads/manifests/*.yaml
```

Perform the upgrade

Steps

1. Copy the `astradsoperator.yaml` file to the local directory:

```
cp /PATH/TO/FILE/astradsoperator.yaml ./
```

2. Upgrade the operator. Replace arguments in capital letters with the appropriate information for your environment:

```
kubectl-astrads upgrade ads-operator --repository-url REPOSITORY_URL  
--operator-yaml astradsoperator.yaml
```

3. Begin the Astra Data Store upgrade. Replace arguments in capital letters with the appropriate information for your environment:

```
kubectl-astrads upgrade ads-version --repository-url REPOSITORY_URL  
--ads-version-yaml ./astrads/manifests/astradsversion.yaml
```

A message appears notifying you that the upgrade has started, and will take a few minutes to complete.

Uninstall Astra Data Store with an automated script

To uninstall Astra Data Store and control plane, you will remove workloads, bindings, volumes, export policies, the Astra Data Store cluster, license, deployment environment, and the Astra Data Store namespace.

Uninstalling can be done using different methods:

- [Uninstall Astra Data Store with an automated script](#)
- [Uninstall Astra Data Store manually without a script](#)
- [Troubleshoot the Astra Data Store uninstall process](#)

Uninstall Astra Data Store with an automated script

This process uses an automated script to uninstall Astra Data Store.

What you'll need

- Root administrative permissions

About this task

The Astra Data Store uninstallation process guides you through the following high-level steps:

- [Remove existing workloads and bindings](#)
- [Uninstall Astra Data Store cluster](#)
- [Validate the removal of the astrads-system namespace](#)
- [Ensure containers are not running on worker nodes](#)
- [Delete OpenShift Container Platform resources](#)

Remove existing workloads and bindings

Before uninstalling Astra Data Store, you must first remove the following

- All application workloads that use Astra Data Store as the storage backend
- Trident bindings that use Astra Data Store as a backend

This ensures that your Kubernetes environment is left in a clean state, which is important if you reinstall.

Uninstall Astra Data Store cluster

To uninstall Astra Data Store, you can use the `uninstall.sh` script in your Astra Data Store tar file that was downloaded from the NetApp Support Site.

1. Locate the `uninstall.sh` in the `manifests` directory.
2. Run the following `sed` command:

```
sed -i -e 's~netappsdsoperator.yaml~astradsoperator.yaml~' uninstall.sh
```

3. Run the following script indicating what you want to uninstall:

```
./uninstall.sh
```

You must run this script with an argument specifying what should be uninstalled

To uninstall the ADS cluster run `./uninstall.sh cluster`

To uninstall everything run `./uninstall all`

4. If you want to uninstall just the cluster, enter `uninstall.sh <cluster>`

Otherwise, if you want to uninstall everything, enter `uninstall.sh`

In most cases you will uninstall everything. You might want to uninstall just the cluster if you wanted to redeploy the cluster subsequently.

5. At the prompt, confirm that you want to continue and enter `erasedata`

Response:

```
./uninstall.sh all
```

Enter 'erasedata' to confirm you want proceed with the uninstall:

```
erasedata
```

```

```

Validate the removal of the astrads-system namespace

Ensure that the following command returns no result:

```
kubectl get ns | grep astrads-system
```

Ensure containers are not running on worker nodes

Validate that containers such as `firetap` or `netwd` are not running on the worker nodes.
Run the following on each node.

```
ssh <mynode1>
# runc list
```

Delete OpenShift Container Platform resources

If you installed Astra Data Store on Red Hat OpenShift Container Platform (OCP), you can uninstall OCP security context constraints (SCC) and rolebindings resources.

OpenShift uses security context constraints (SCC) that control the actions that a pod can perform.

After you complete the standard uninstall process, complete these steps.

1. Remove SCC resources:

```
oc delete -f ads_privileged_scc.yaml
```

2. Remove rolebindings resources:

```
oc delete -f oc_role_bindings.yaml
```

Ignore "resources not found" errors in these steps.

Uninstall Astra Data Store manually without a script

This process uninstalls Astra Data Store manually without a script.

To uninstall Astra Data Store manually without an automated script, you will remove workloads, bindings, volumes, export policies, clusters, license, deployment environment, and the Astra Data Store namespace.

What you'll need

- Root administrative permissions

About this task

The Astra Data Store uninstallation process guides you through the following high-level steps:

- [Remove existing workloads and bindings](#)
- [Uninstall the Astra Data Store cluster and control plane](#)
- [Delete the license](#)
- [Delete the Astra Data Store installation](#)
- [Validate the removal of the astrads-system namespace](#)
- [Ensure containers are not running on worker nodes](#)
- [Delete OpenShift Container Platform resources](#)

Remove existing workloads and bindings

Before uninstalling Astra Data Store, you must first remove the following

- All application workloads that use Astra Data Store as the storage backend
- Trident bindings that use Astra Data Store as a backend

This ensures that your Kubernetes environment is left in a clean state, which is important if you reinstall.

Uninstall the Astra Data Store cluster and control plane

Follow the steps below to uninstall Astra Data Store manually.

Delete the volumes and export policies

Before deleting the cluster, you should delete the Astra Data Store volumes and export policy.

If you do not first delete volumes and export policies, the cluster deletion process pauses until the Astra Data Store volumes objects are deleted. It is more efficient to remove those items before starting to delete the cluster.

Steps

1. Delete the volumes:

```
~% kubectl delete astradsvolumes --all -A
~% kubectl get astradsvolumes -A
```

2. Delete the export policies:

```
~% kubectl delete astradsexportpolicies --all -A
~% kubectl get astradsexportpolicies -A
```

Delete the Astra Data Store cluster

Deleting the cluster deletes only the Astra Data Store cluster object custom resource (CR) along with cluster-scoped resources.

The operator, nodeinfo pods, and the cluster controller (which are Kubernetes-scoped resources) remain even after the cluster is deleted.

Deleting the cluster also uninstalls the underlying operating system from the nodes, which will stop the `firetap` and `netwd` services.

The uninstaller takes about a minute to finish. Then, the removal of the Astra Data Store cluster-scoped resources starts.

1. Delete the cluster:

```
~% kubectl delete astradsclusters --all -A
~% kubectl get astradsclusters -A
```

Delete the license

1. ssh to each worker node in the cluster and validate that `firetap` or `netwd` are not running in the worker nodes.
2. Delete the Astra Data Store license:

```
~% kubectl delete astradslicenses --all -A
~% kubectl get astradslicenses -A
```

Delete the Astra Data Store installation

Delete the controllers, operators, namespace, and support pods in the cluster.

1. Delete the Astra Data Store installation object:

```
~% kubectl delete astradsversion astradsversion -n astrads-system
~% kubectl get astradsversion -n astrads-system
```

2. Delete the data store DaemonSets and all Astra Data Store controller resources:

```
~% kubectl delete ds --all -n astrads-system
~% kubectl get ds -n astrads-system

~% kubectl delete deployments --all -n astrads-system
~% kubectl get deployments -n astrads-system
```

3. Delete remaining artifacts and the operator yaml file:

```
~% kubectl delete -f ./manifests/astradsoperator.yaml
~% kubectl get pods -n astrads-system
```

Validate the removal of the astrads-system namespace

Ensure that the following command returns no result:

```
~% kubectl get ns | grep astrads-system
```

Ensure containers are not running on worker nodes

Validate that containers such as `firetap` or `netwd` are not running on the worker nodes. Run the following on each node.

```
ssh <mynode1>
# runc list
```

Delete OpenShift Container Platform resources

If you installed Astra Data Store on Red Hat OpenShift Container Platform (OCP), you can uninstall OCP security context constraints (SCC) and rolebindings resources.

OpenShift uses security context constraints (SCC) that control the actions that a pod can perform.

After you complete the standard uninstall process, complete these steps.

1. Remove SCC resources:

```
oc delete -f ads_privileged_scc.yaml
```

2. Remove rolebindings resources:

```
oc delete -f oc_role_bindings.yaml
```

Ignore "resources not found errors" in these steps.

Manual deletion sample

The following shows a sample of an execution manual uninstallation script.

```
$ kubectl delete astradsvolumes --all -A
No resources found
$ kubectl delete astradsexportpolicies --all -A
No resources found
$ kubectl delete astradsclusters --all -A
astradscluster.astrads.netapp.io "astrads-sti-c6220-09-10-11-12" deleted

```

Troubleshoot the Astra Data Store uninstall process

If you need to troubleshoot the uninstall process, review the following suggestions.

Pods in terminating state

The Astra Data Store uninstall process can occasionally cause pods to remain in a terminating state in Kubernetes.

If this issue occurs, run the following command to force delete all pods in the `astrads-system` namespace:

```
kubectl delete pods --all -n astrads-system --force --grace-period 0
```

Quality of Service policy points to old cluster

If you delete the Astra Data Store Cluster only and redeploy it, you might not be able to create a persistent volume claim (PVC) or volume because the Quality of Service (QoS) policy points to the old cluster and cannot be found.

1. To avoid this, after deleting the Astra Data Store cluster, manually delete the QoS policy:

```
kubectl delete AstraDSQosPolicy --all -A
```

2. Delete the entire Astra Data Store deployment (not just the cluster):

```
uninstall.sh all
```

Key provider CRs not removed after deleting or uninstalling Astra Data Store

If an external key provider has been configured for an Astra Data Store cluster that is being deleted or uninstalled, you might need to manually clean up any key provider CR that was not removed.

Details

Use the following workaround instructions:

Steps

1. Confirm that the key provider CRs were not removed:

```
kubect1 get astradskeyprovider --selector  
astrads.netapp.io/cluster=astrads-cluster-example -n astrads-system
```

Response:

NAME	AGE
externalkeyprovider1	94s

2. Remove the key provider CRs:

- a. Remove the finalizer:

```
kubect1 edit astradskeyprovider -n astrads-system
```

- b. Remove the finalizer line highlighted below:

```
kubect1 edit astradskeyprovider externalkeyprovider1 -n astrads-  
system
```

```

apiVersion: astrads.netapp.io/v1beta1
kind: AstraDSKeyProvider
metadata:
  creationTimestamp: "2022-05-24T16:38:27Z"
  finalizers:
    - astrads.netapp.io/astradskeyprovider-finalizer
  generation: 1
  labels:
    astrads.netapp.io/cluster: astrads-cluster-example
    astrads.netapp.io/rsid: "1"
  name: externalkeyprovider1
  namespace: astrads-system
  resourceVersion: "1134699"
  uid: a11111b2-31c0-4575-b7f3-97f9ab1a1bla
spec:
  cluster: astrads-cluster-example
  kmipServer:
    hostnames:
      - 10.xxx.xxx.xxx
    port: 5696
    secretRef: externalkeyprovider1
status:
  keyProviderUUID: a1b2cd34-4fc6-5bae-9184-2288c673181d
  kmipServerStatus:
    capabilities: '{ KMIP_library_version()=17367809,
KMIP_library_version_str()="KMIP
1.9.3a 8-Apr-2019", KMIP_library_version_tag()="KMIP part
of KMIP 1.9.3a 8-Apr-2019",
KMIP_library_is_eval()=false,
KMIP_library_fips_capable()=true(FIPS140),
KMIP_SSL_provider_build_version()=268444095,
KMIP_SSL_provider_version()=268444095,
KMIP_SSL_provider_version_str()="OpenSSL
1.0.2zb-fips 23 Sep 2021" }'
  keyServerUUID: 8422bdd0-74ad-579d-81bd-6d544ac4224a

```

c. After the finalizer has been removed, delete the key provider CR:

```

kubectl delete astradskeyprovider <key-provider-cr-name> -n
astrads-system

```
